

Title: Thermax 10 Level B

Sector: Automotive

Overview: Quality Leather Manufacturing

Introduction/Project

Throughout the world, automotive manufacturers put their trust in the quality of a leading international leather manufacturer.

Aim:

Producing over 40,000 sq metres of high quality automotive leather per day, this company use state of the art production facilities and quality control features to guarantee their consistently high levels of customer satisfaction. Therefore they must ensure that the correct temperatures are reached during the manufacturing process.

Note: Pictures for example only

Solution:

Thermax® 10-Level Range B Strips are used in the process to verify the processing temperatures during the production of the automotive leather.

The customer will not disclose the exact nature of the use of the large volume of strips that they buy, due to the proprietary nature of the process, however, we believe it is possibly related to the adhesive used in the process (similar to the glue line temperatures used in the textile industry).
